

# THE EFFECT OF CARBON DIOXIDE EMISSION ON GLOBAL WARMING

허재영 박종욱 좌민채 백승윤 전예준 (9조)

# INDEX

## Background Theorem

- The First law of thermodynamics
- Dalton's law
- Henry's law

## Some of Assumption

- Some Assumption for Application

## Application to the Earth System

- Part 1
- Part 2
- Result : Part1 + Part2

# Background Theorem

# Background Theorem

## The First Law of Thermodynamics

**The sum of heat and work in a system is constant**

1. Heat is a form of energy(Joules law)
2. Energy is conserved,  $Q = \Delta U + \Delta W$

where  $Q$  = heat

$\Delta U$  = change of internal energy of the system

$\Delta W$  = work done by the system

In general, for a unit mass we write

$$dq = du + dw$$

# Background Theorem

## Dalton's law

Note that each individual gas obeys the ideal gas law.

Following this law, we can derive the specific gas constant for the mixture of air gases

$$P = \sum_i P_i, PV = \sum_i n_i RT = RT \sum_i n_i$$

# Background Theorem

## Henry's law

formulated by William Henry in 1803

At a constant temperature, the amount of a given gas that dissolves in a given type and volume of liquid is directly proportional to the partial pressure of that gas in equilibrium with that liquid.

$$C = H \times P_{\text{gas}}$$

C : solubility of a gas at fixed temperature in a particular solvent

H : Henry's law constant

$P_{\text{gas}}$  : the partial pressure of the gas

# Background Theorem

## Henry's law

Henry's law Constant is Temperature dependence

Find Henry's law by the Experiment(Plummer and Busenberg)

$$\log H_{\text{CO}_2, \text{w}} = 108.3865 + 0.01985076 \cdot T - \frac{6919.53}{T} - 40.45154 \cdot \log T + \frac{669365}{T^2}$$

\*Unit

H : mol/(kg atm)

T : K

# Background Theorem

## Heat of Solution

The Enthalpy change associated with the dissolution of a substance in a solvent at constant pressure, resulting in infinite dilution.

expressed in kJ/mol, and it is the amount of heat energy that is released or absorbed when a solution is formed

# **Some of Assumptions for Application**

# Some of Assumptions

The ratio of land and Ocean

land : Ocean = 0.29 : 0.71

# Some of Assumptions

## The material of Ocean

Assume the Ocean is made up of pure water only

Problem : It's hard to see the effects of salinity

# Some of Assumptions

## The Radiation Effect between Ocean and Atmosphere

Assume the Ocean's Radiation(infrared) absorb into the atmosphere and space by 20:1

Figure 1. Depth of extinction of the solar radiation spectrum in water

# Some of Assumptions

## The matter exchange between Ocean and Atmosphere

Assume the matter exchange occur at mixed layer.

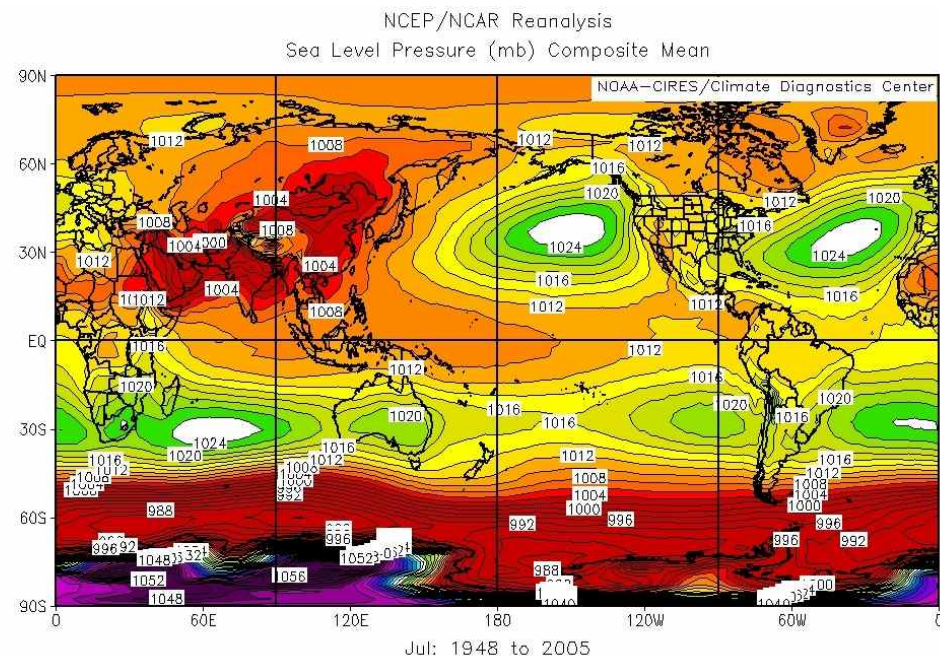

# Some of Assumptions

The air pressure

Assume the surface pressure is 1000hPa.

1bar = 1 atm

# **Application to the Earth System**

# Application to the Earth System

## Part 1

# Application to the Earth System –Part 1

The Volume and area of Ocean

$$\begin{aligned} V_{total} &= 0.71 \times \int_{R-d}^R 4\pi r^2 dr \\ &= 0.71 \int_{6371-0.2}^{6371} 4\pi r^2 dr \\ &= 7.24 \times 10^7 km^3 = 7.24 \times 10^{16} m^3 \end{aligned}$$

$$A_{total} = 0.71 \times 4\pi R^2 = 3.6215 \times 10^{14} m^2$$

# Application to the Earth System –Part 1

Calculate molarity of CO<sub>2</sub>

$$m_{CO_2} = HP_{CO_2}$$

$$\ln H_{CO_2,w} = 108.3865 + 0.0198507T - 6919.53/T - 40.45154 \ln T + 669365/T^2$$

$$d \ln H_{CO_2,w} = 0.0198507 dT - d\left(\frac{6919.53}{T}\right) - 40.45154 d \ln T + d\left(\frac{669365}{T^2}\right)$$

$$dH_{CO_2} = H_{CO_2} \left( 0.0198507 + \frac{6919.53}{T^2} - \frac{40.45154}{T} - \frac{2 \times 669365}{T^3} \right) dT \quad (\text{단위 : mol/(kg*bar)})$$

# Application to the Earth System

## –Part 1

Difference in heat of dissolution

$$dm_{\text{CO}_2} = (HdP_{\text{CO}_2} + P_{\text{CO}_2}dH)$$

$$\rho V_{\text{total}} \times dm_{\text{CO}_2} = (HdP_{\text{CO}_2} + P_{\text{CO}_2}dH)\rho V_{\text{total}}$$

$$dP_{\text{CO}_2} = P_0 dw_{\text{CO}_2} : \text{돌턴의 부분 압력 법칙}$$

$$dm_{\text{CO}_2} = (HP_a dw_{\text{CO}_2} + P_{\text{CO}_2}dH)$$

# Application to the Earth System –Part 1

Difference in heat of dissolution

$$dw_{CO_2} = \frac{m_{CO_2} + dm_{CO_2}}{m_{all \ gas}} = \frac{2.533 \times 10^{16} + dm_{CO_2}}{1.40 \times 10^{20}}$$

$$|dP_{CO_2} = P_a \left( \frac{m_{CO_2} + dm_{CO_2}}{m_{all \ gas}} \right) = P_a \left( \frac{2.533 \times 10^{16} + dm_{CO_2}}{1.40 \times 10^{20}} \right)$$

# Application to the Earth System

## –Part 1

Difference in heat of dissolution

$$dw_{CO_2} = \frac{m_{CO_2} + dm_{CO_2}}{m_{all\ gas}} = \frac{2.533 \times 10^{16} + dm_{CO_2}}{1.40 \times 10^{20}}$$

$$dP_{CO_2} = P_a \left( \frac{m_{CO_2} + dm_{CO_2}}{m_{all\ gas}} \right) = P_a \left( \frac{2.533 \times 10^{16} + dm_{CO_2}}{1.40 \times 10^{20}} \right)$$

$$dm_{CO_2} = (HP_a \left( \frac{1.533 \times 10^{16} + dm_{CO_2}}{1.40 \times 10^{20}} \right) + P_{CO_2} dH(T))$$

# Application to the Earth System –Part 1

Difference in heat of dissolution

$$dm_{CO_2} - HP_a \frac{dm_{CO_2}}{1.40 \times 10^{20}} = HP_a \times (1.1 \times 10^{-14}) + P_{CO_2} dH_{CO_2, w}$$

$$dm_{CO_2} = \frac{10^{-14} H_{CO_2} P_a + P_{CO_2} H_{CO_2} \left[ 0.01985076 + \frac{6919.53}{T^2} - \frac{40.45154}{T} - \frac{2 \times 669365}{T^3} \right] dT}{\left( 1 - H_{CO_2} P_a \frac{1.1}{1.4 \times 10^{20}} \right)}$$

$$\Delta m_{CO_2} = \frac{10^{-14} H_{CO_2} P_a (T' - T) + P_{CO_2} H_{CO_2} \left[ 0.01985076 (T' - T) - \left( \frac{6919.53}{T'} - \frac{6919.53}{T} \right) - 40.45154 \ln T'/T + \left( \frac{669365}{T'^2} - \frac{669365}{T^2} \right) \right]}{\left( 1 - H_{CO_2} P_a \frac{1.1}{1.4 \times 10^{20}} \right)}$$

$$\Delta H = -19.4 \Delta m_{CO_2} (kJ)$$

# Application to the Earth System –Part 1

If Temperature increase 0.1 Celsius

$$H_{CO_2} = 29.3 \text{ mol m}^{-3} \text{ bar}^{-1}$$

$$P_a = 100000 \text{ pa} = 1 \text{ bar}, \quad P_{CO_2} = 0.00033 \text{ bar}$$

$$T = 25^\circ\text{C} = 298 \text{ K}$$

Gas	Partial pressure in atmosphere [bar]	Henry's law coefficient [mol/(m <sup>3</sup> bar)]	Concentration in seawater	
			[μmol/kg SW]	[mg/kg SW]

# Application to the Earth System –Part 2

## Green House effect by CO2 emission

**Table 2.2:** Expressions used to derive radiative forcing for past trends and future scenarios of greenhouse gas concentrations

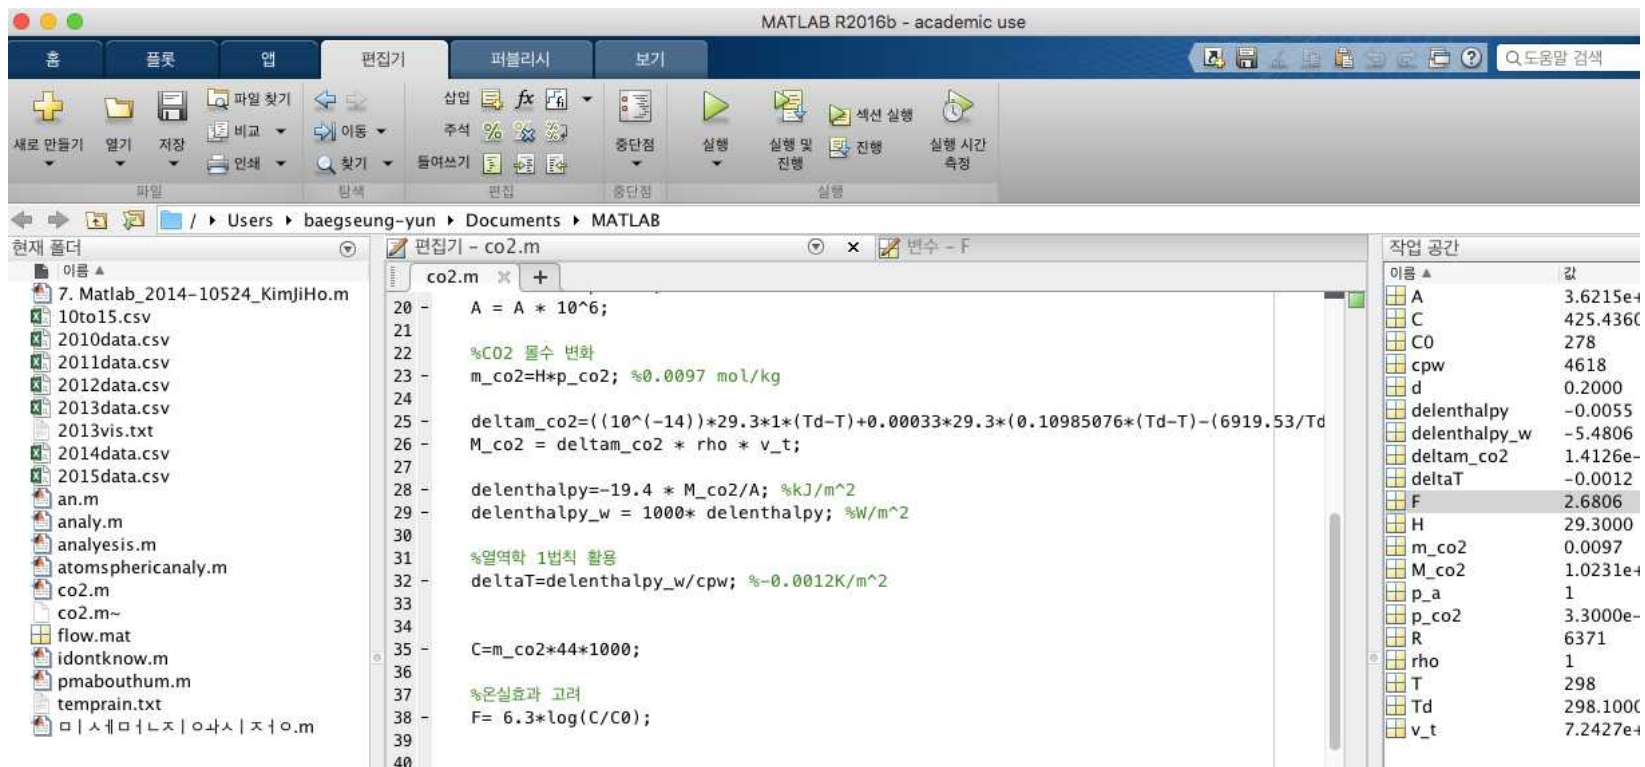

TRACE GAS	RADIATIVE FORCING APPROXIMATION GIVING $\Delta F$ IN $Wm^{-2}$	COMMENTS
Carbon dioxide	$\Delta F = 6.3 \ln (C/C_0)$ where C is CO <sub>2</sub> in ppmv for C < 1000 ppmv	Functional form from Wigley (1987), coefficient derived from Hansen et al (1988)
Methane	$\Delta F = 0.036 (\sqrt{M} - \sqrt{M_0}) -$ $(f(M, N_0) - f(M_0, N_0))$ where M is CH <sub>4</sub> in ppbv and N is N <sub>2</sub> O in ppbv Valid for M < 5ppmv	Functional form from Wigley (1987), coefficient derived from Hansen et al (1988) Overlap term, f(M, N) from Hansen et al (1988)*
Nitrous Oxide	$\Delta F = 0.14 (\sqrt{N} - \sqrt{N_0}) -$ $(f(M_0, N) - f(M_0, N_0))$ with M and N as above Valid for N < 5ppmv	Functional form from Wigley (1987), coefficient derived from Hansen et al (1988) Overlap term from Hansen et al (1988)*

$C_0 = 278$  ppm, C can be derived by  $dm_{CO_2}$

# Application to the Earth System –Part 2

Green House effect by CO2 emission

$$\Delta H_2 = 2.6806 \text{ J/m}^2$$

The image shows the MATLAB R2016b - academic use interface. The main window displays a script named 'co2.m' with the following code:

```
20 A = A * 10^6;
21
22 %CO2 몰수 변화
23 m_co2=H*p_co2; %0.0097 mol/kg
